

BI-IG

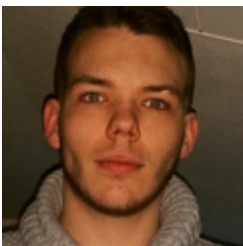

The BIIG project aims to create a new kind of business intelligence software specialised in data exploration and visualization.

The idea came up while chilling after work and talking about the Business Intelligence environment. We discovered that during our work in this segment we faced the same weaknesses and problems. While an active exchange of first-hand experience we decided that it is about time to change the concept of Business Intelligence.

We believe that it is time to not only improve but revolutionise the way we handle data. We want to bring the 3rd dimension into our thinking pattern by using the latest technologies.

With the complete system the user will be able to fully understand the characteristic of the data he or she is working on in much less time than receiving the information in conventional ways like reading or calculating.
