

Cloudheizung

Our project aims to deliver a full inside view for the end-consumer of an average household and energy consultants regarding the energy efficiency from their surroundings.

We will combine different sensor-data on critical resource-consuming equipment. These data will be aggregated and abstracted. After uploading them to the cloud, every SEM user will be guaranteed access to their personal customized surrounding energy data.

Our main goal is to call attention to the energy consumption in our everyday life and encourage ourselves and our user to manage their valuable and partly unrecoverable energy resource meaningfully. We will provide informative data visualization about user consumption behavior, additional tips or methods for them in order to help them reducing their energy consumption.
