

# DataLook

In a world in which data has become ubiquitous, DataLook is a web platform that connects nonprofit managers and (local) government officials who want to implement data-driven solutions to their problems with (volunteer) data scientists and web developers who are inspired to replicate the projects showcased on DataLook.

In contrast to other directories which list data-driven projects for social good, our platform dramatically increases the chances of a project to be replicated by routing organizations/agencies directly to volunteers with the necessary skills (our USP).

We believe that we can maximize the number of replications by making it as easy as possible for organizations and agencies to understand the potential of data for solving their problems and to help them tap the potential of digital volunteers (our mission).

We strive for a world in which reusable data-driven projects for social good reach their utmost impact (our vision).
