SENSORHOME

SENSORHOME will create a unique marketplace, a custom made Dashboard tailored to clients' requirements/needs, where all data collected in buildings can be collected and utilised to extrapolate behaviour analysis.

SENSORHOME dashboard will also provide individualised windows to the tenants of the individual units (offices and/or apartments). Tenants will thus be informed at any point in time of their consumption, state of each device (need maintenance?), efficiency levels.

In the first expansion stage we will work on our prototype and make all data sources usable via a joint interface – that is: Light control, heating control, motion and humidity sensors. Reading and controlling will be possible through a command line interface. Additionally a simple visualisation is provided for presenting the data visually (Dashboard).
